

Thoracolumbar Decompressive Laminectomy T12-L4,
Revision L4/5 followed by
Instrumentation/Posterolateral Fusion T10-S1.

Rec: Irrigate when collecting the drilled bone shavings, if the surgical bed is dry.

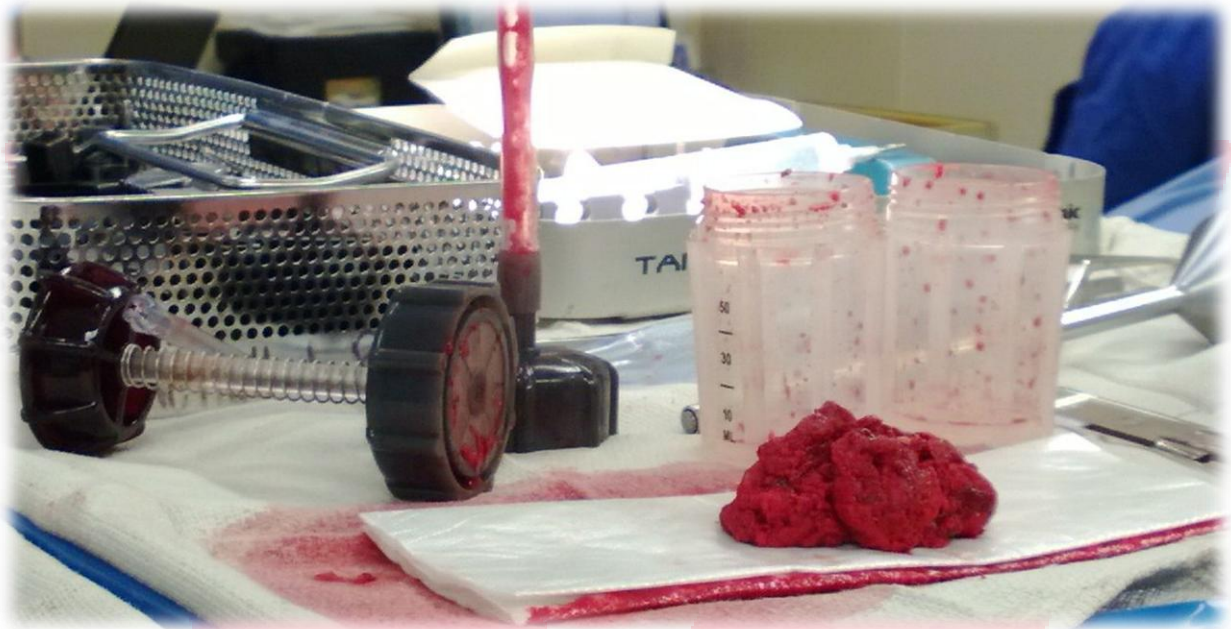

Points of Interest:

- We used sizes 40 and 50 cutting burrs .
- Over 40 cc of autologous bone was harvested.
- We used every cc of autologous bone. The bone was utilized for:
 - 3 interbody implants. (L1-L4)
 - Posterolateral fusion from T10-S1.
- Nominal DBM was used.
- No Biologics was utilized.
- The HBP bone was easily used with the funnel for disc space filler prior to interbody implantation.
- TIP: Inserts and passes freely within funnel applications for autologous bone placement, such as minimally invasive TLIF interbody grafts.
